

Human Impacts on Earth's Surface – Teacher Resource

Intended Use of Resources

This project has been designed so that teachers from different STEM areas can pick and choose sections relevant to their subject area to work on. All activities in this package do not need to be completed to get value from the package – each activity can be completed as a stand-alone or can be approached, as a team, as a larger project. The package has potential to be extended into a much longer project to include curriculum points from different STEM subjects.

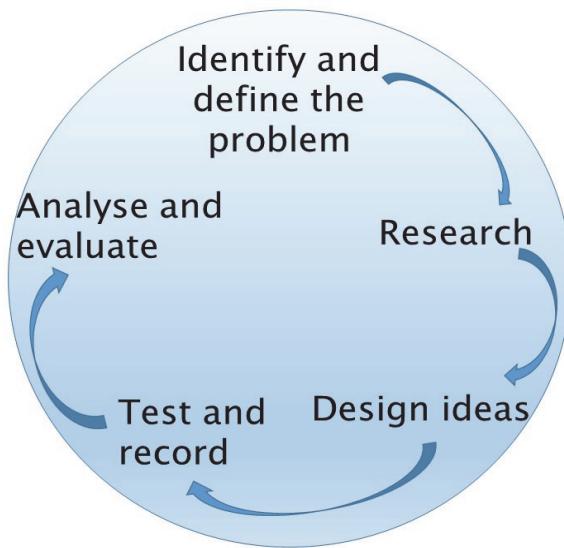

There are three **student workbooks - Open, Guided and Scaffolded**, that go along side this resource; all have the same suggestions for activities, however they have been written and edited to provide differentiated learning options to support good teaching practice. Teachers may pick and choose which versions they give which students and may wish to edit them further to address their learning needs. Due to the differentiation of the workbooks, the **Open** activities will enable more syllabus links to be addressed, which is why each activity has its own syllabus links key. However, if you wish to give a truly open-ended investigation then you could just give the students the challenge and background information section of the Student Workbook.

The Woodside Australia STEM Project aims to be accessible and supportive for teachers and students, please contact us if you have questions, require assistance or would like to arrange an incursion or a professional development workshop - www.wasp.edu.au

The Challenge

Humans have evolved over time. Humans have learnt to make tools, farm and produce goods in ways that other animals haven't. Your challenge is to investigate how human activities change the surface of the Earth.

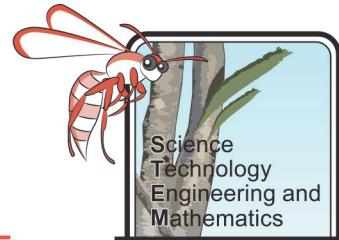

Background Information

Humans need food to survive. As our global population grows more quickly than ever before, so too does the demand for food. Most of our food comes from large farms with crops or livestock, such as sheep and cows. This has led to large scale removal of vegetation to clear areas for farmland, such as jungles, woodlands and bushland which changes much of the surface of the Earth.

Many of us also live in a 'consumer culture' in which we are told that we need lots of things. In this modern world we use a lot of technology, such as phones, computers and tablets. To build these devices we first need the raw materials, such as minerals, metals and oil, which are extracted from the Earth by mining. This involves removing rocks and materials from the Earth. Mining can greatly impact the surface features of the Earth. With that said, mining companies are now more environmentally aware and will rehabilitate an area once they have finished, by replanting vegetation.

If we look at satellite pictures of the Earth by night, like the one below, we can see where there are cities as they are lit up. Buildings and infrastructure (roads, railways etc) have stamped their mark on the Earth's surface. Where once there were trees and plants, there

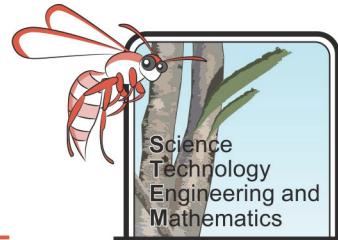

Human Impacts on Earth's Surface – Teacher Resource

are now towns. Even hillsides are often flattened to make way for buildings and roads.

Figure 1. Satellite picture of Earth by night (NASA, 2016)

Human Impacts on Earth's Surface – Teacher Resource

Activities

This booklet contains extra information on each activity, including syllabus links the overall activity objective, suggestions for recommended equipment or alternative ways to run investigations as well as useful resources and website links. Please note that any reference websites provided in the entirety of our resource documents were current at the time of publication. Please advise if links are no longer accessible.

The syllabus links have been colour coded – please see the colour key below:

Covered in Scaffolded, Guided and Open student workbook

Human Impacts on Earth's Surface – Teacher Resource

Background Research

Objective

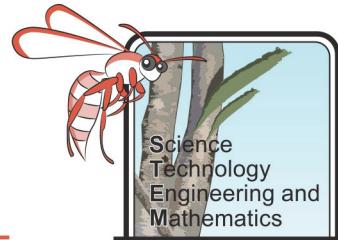

In this activity, students will gain more understanding about what erosion is. They will research different ways in which human activities can cause erosion and some ways to prevent erosion. In the Open booklet, they will research the rate at which soil is created and eroded and discuss if soil is a renewable resource.

In the Scaffolded and Guided booklet, students are given suggested websites to use. In the Open booklet, students are asked to reference any sources they use for research.

Human Impacts on Earth's Surface – Teacher Resource

Walking away the Earth

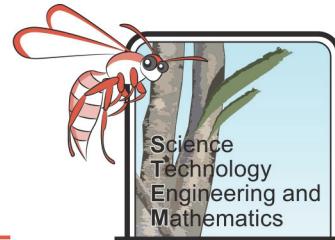

Objective

In this activity, students will investigate how animals (humans) can cause erosion of soils just from walking over it. Students using the Open booklet will design their own experiment to investigate this.

This activity focuses on investigation skills and data collection, management, and analysis. Students can use Excel or similar software to create a table and draw a graph of their results.

For this investigation it is better if you have a whole class take part or get the students to take multiple steps to show most variation.

Human Impacts on Earth's Surface – Teacher Resource

Adding to the Earth

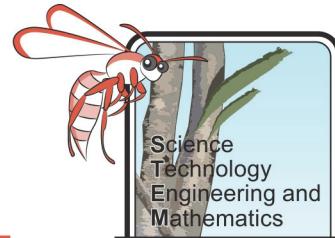

Objective

Students will investigate how the materials we use, and dispose of, can change the Earth's surface. They will look at how materials decompose (or don't) over a timescale.

This activity focuses on investigation skills. Students with the Open booklet will plan their own investigation. Guided students will improve a method and focus on fair testing about how to collect, present and analyse results. Scaffolded students will follow a method to safely investigate. All students will evaluate their experiment.

Students will consider what will happen in areas, like landfill sites, where large accumulations of non- biodegradable waste is placed.

Human Impacts on Earth's Surface – Teacher Resource

Keeping it Together

Objective

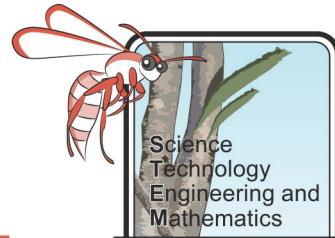

Students carry out an investigation to find out to what extent plant roots help hold soil together and prevent erosion. They then discuss their findings in relation to why deforestation and land clearing could add to erosion and change the Earth's surface.

For the Scaffolded and Guided students, they are given a list of equipment and a method. The Open students must design their own investigation, this includes coming up with their own equipment list. All students will evaluate their investigation.

Scaffolded students discuss observations and collect qualitative data, whereas the Guided and Open students collect and compare quantitative data through creation of graphs and data displays.

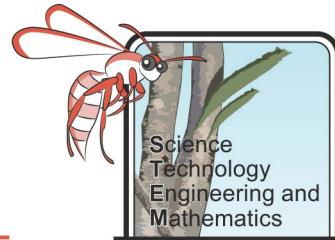

Students may want to come with a rating scale (1 – 5) of how easy it was to pull out a weed as this will give them more quantitative data. They can also discuss how reliable using such a scale is. They will generally find that the harder the weed is to pull up the more soil it will have held in its roots. However, they may not be the longest roots; some plants have lots of short roots which will hold lots of soil together. Another extension they could do would be to weigh the roots once they were free from soil and look for a relationship between the weight of the soil held in the roots and the weight of the roots.

Human Impacts on Earth's Surface – Teacher Resource

Earth from Above

Objective

Students use Google Maps to find evidence of civilisation and compare the extent of different human practices (mining, farming and building infrastructure). Students take screenshots and use the measurement tool to gather information about different practice types. Students compare the data and discuss the impact of different types of human practices. They use their findings to create a presentation.

As an extension activity, students may want to look at historical maps of cities and compare them to Google Maps images. You can also go into street view and look at how areas have changed (although this might not be very much).

Human Impacts on Earth's Surface – Teacher Resource

Contour Ploughing

Objective

In this activity students investigate if different ploughing methods affect erosion rates. This enables student to discuss whether farmers could improve their practices to reduce erosion, which would in turn benefit their land as the soil would not be lost so quickly.

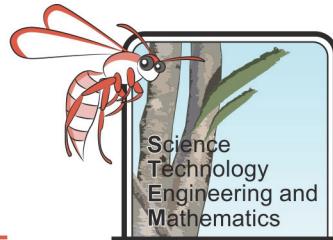

For the Scaffolded and Guided students, they are given a list of equipment and a method. The Guided students are asked to improve the method they are given. They should consider how they will get data from the investigation – for example they should consider if it is important that each side of the hill being ploughed has the same number of beads on it. They may also like to think if there is any way they can collect sand that falls down the hillside and weigh it, to compare which side lost the most sand. Perhaps they could draw around the base of their sandcastle before ploughing and then redraw after ploughing, to determine which side increased the most. The Open students must design their own investigation this includes coming up with their own equipment list, again they should be encouraged to consider what data they will collect to enable them to answer the investigation question. All students will evaluate their investigation and consider how it could be improved and extended.
